# Lesson 10: Operations with Numbers in Scientific Notation 

Classwork

## Exercise 1

The speed of light is $300,000,000$ meters per second. The sun is approximately $1.5 \times 10^{11}$ meters from Earth. How many seconds does it take for sunlight to reach Earth?

## Exercise 2

The mass of the moon is about $7.3 \times 10^{22} \mathrm{~kg}$. It would take approximately $26,000,000$ moons to equal the mass of the sun. Determine the mass of the sun.

## Exercise 3

The mass of Earth is $5.9 \times 10^{24} \mathrm{~kg}$. The mass of Pluto is $13,000,000,000,000,000,000,000 \mathrm{~kg}$. Compared to Pluto, how much greater is Earth's mass?

## Exercise 4

Using the information in Exercises 2 and 3, find the combined mass of the moon, Earth, and Pluto.

## Exercise 5

How many combined moon, Earth, and Pluto masses (i.e., the answer to Exercise 4) are needed to equal the mass of the sun (i.e., the answer to Exercise 2)?

## Problem Set

1. The sun produces $3.8 \times 10^{27}$ joules of energy per second. How much energy is produced in a year? (Note: a year is approximately $31,000,000$ seconds).
2. On average, Mercury is about $57,000,000 \mathrm{~km}$ from the sun, whereas Neptune is about $4.5 \times 10^{9} \mathrm{~km}$ from the sun. What is the difference between Mercury's and Neptune's distances from the sun?
3. The mass of Earth is approximately $5.9 \times 10^{24} \mathrm{~kg}$, and the mass of Venus is approximately $4.9 \times 10^{24} \mathrm{~kg}$.
a. Find their combined mass.
b. Given that the mass of the sun is approximately $1.9 \times 10^{30} \mathrm{~kg}$, how many Venuses and Earths would it take to equal the mass of the sun?
