Lesson 8: Sequencing Reflections and Translations
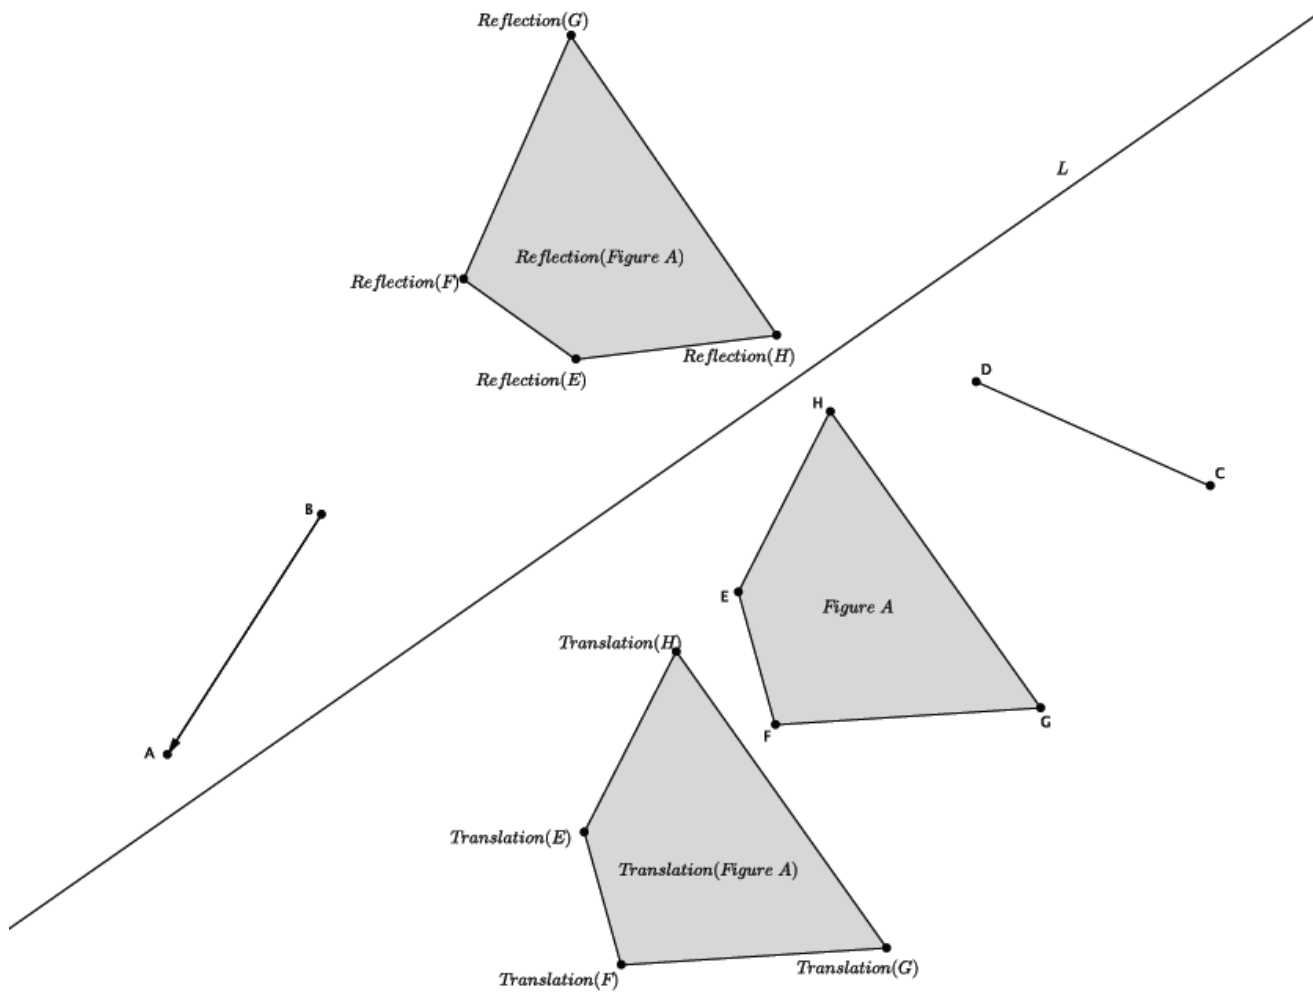

## Classwork

Exercises

Use the figure below to answer Exercises 1–3.

[Type here]

1. *Figure A* was translated along vector $\overrightarrow{BA}$ resulting in $Translation(Figure\ A)$. Describe a sequence of translations that would map *Figure A* back onto its original position.

2. *Figure A* was reflected across line L resulting in $Reflection(Figure\ A)$. Describe a sequence of reflections that would map *Figure A* back onto its original position.

3. Can $Translation_{\overline{BA}}$ undo the transformation of $Translation_{\overline{DC}}$? Why or why not?

[Type here]

Use the diagram below for Exercises 4- 5.

4. Let there be the translation along vector $\overrightarrow{AB}$ and a reflection across line L. Let the black figure above be figure S. Use a transparency to perform the following sequence: Translate figure S, then reflect figure S. Label the image S'.

5. Let there be the translation along vector $\overrightarrow{AB}$ and a reflection across line L. Let the black figure above be figure S. Use a transparency to perform the following sequence: Reflect figure S, then translate figure S. Label the image S''

6. Using your transparency, show that under a sequence of any two translations, $Translation$ and $Translation_0$ (along different vectors), that the sequence of the $Translation$ followed by the $Translation_0$ is equal to the sequence of the $Translation_0$ followed by the $Translation$. That is, draw a figure, A, and two vectors. Show that the translation along the first vector, followed by a translation along the second vector, places the figure in the same location as when you perform the translations in the reverse order. (This fact will be proven in high school). Label the transformed image A'. Now draw two new vectors and translate along them just as before. This time label the transformed image A''. Compare your work with a partner. Was the statement that "the sequence of the $Translation$ followed by the $Translation_0$ is equal to the sequence of the $Translation_0$ followed by the $Translation$" true in all cases? Do you think it will always be true?

7. Does the same relationship you noticed in Exercise 6 hold true when you replace one of the translations with a reflection. That is, is the following statement true: A translation followed by a reflection is equal to a reflection followed by a translation?

[Type here]

Lesson Summary

A reflection across a line followed by a reflection across the same line places all figures in the plane back onto their original position.

A reflection followed by a translation does not place a figure in the same location in the plane as a translation followed by a reflection. The order in which we perform a sequence of rigid motions matters.

Problem Set

1. Let there be a reflection across line L and let there be a translation along vector $\overrightarrow{AB}$ as shown. If S denotes the black figure, compare the translation of S followed by the reflection of S with the reflection of S followed by the translation of S.
2. Let L_1 and L_2 be parallel lines and let $Reflection_1$ and $Reflection_2$ be the reflections across L_1 and L_2, respectively (in that order). Show that a $Reflection_2$ followed by $Reflection_1$ is not equal to a $Reflection_1$ followed by $Reflection_2$. (Hint: Take a point on L_1 and see what each of the sequences does to it.)
3. Let L_1 and L_2 be parallel lines and let $Reflection_1$ and $Reflection_2$ be the reflections across L_1 and L_2, respectively (in that order). Can you guess what $Reflection_1$ followed by $Reflection_2$ is? Give as persuasive an argument as

[Type here]

you can. (Hint: Examine the work you just finished for the last problem.)
